Sorghum Seed Treatment Options

- Untreated Seed

Seed remains untreated but has been processed through equipment that has had treated seed processed through it. This seed could be used by our Organic Seed growers. Always read and understand your Organic Seed production guidelines before purchasing untreated seed

- Standard Treated Seed

This is our basic seed treatment option. The seed treatment includes protection against storage type grain pests and provides limited benefit to planted seed and seedlings.

- Safened Treated Seed -> Concep III Treated Seed

Concep III is a herbicide antidote which, when used as a seed treatment, protects grain and forage sorghum from herbicidal injury due to *S-metolachlor* containing herbicides. *S-metolachlor* containing products will cause severe sorghum injury without a Concep III seed treatment. Concep III protects sorghum from the phytotoxic effects of *S-metolachlor*. Always read, understand and follow label directions when applying herbicide to your crop.

- Insecticide Treated Seed -> Senator 600 FS Treatment

Senator 600 FS seed applied insecticide provides unbeatable protection against the toughest early season pests. It starts working on contact to protect the roots and get seed off to a good start. And with its systemic activity, Senator 600 FS keeps protecting young plants to help ensure a good stand. Plus, Senator offers the seed safety needed for proper crop emergence and stand establishment.
